Preface

The survey is carried out according to guidelines in NS 9410:2016 which includes evaluation of sediment, faunal investigation and bottom topography. The environmental survey is regulated by § 35 in the Norwegian «akvakulturdriftsforskriften». The survey also fulfills the requirements regarding bottom surveys in the standard ISO 12878.

The primary objective of a B-survey is to fulfil the requirements regarding bottom survey in the local impact zone at fallow period as they are defined in NS9410:2016. There is a requirement of 22 sampling stations within the mooring lines of the fish farm. The estimated max biomass for the next generation farmed salmon at the site Eyri is 7.448 ton.

The following have participated in the survey:

Arnþór Gústavsson	Akvaplan-niva AS	Prosjektleder.
Arnþór Gústavsson	Akvaplan-niva AS	Fieldwork and Report. Charts (Olex).
Snorri Gunnarsson	Akvaplan-niva AS	Quality assurance

The sampling at Eyri was done 28.05 2021.

Accredited survey:

The following parts of the survey are done in accordance with accreditation methods:

Sampling and treatment of sediment samples, analysis of samples and evaluations of the results. It should be pointed out that as Icelandic officials have not set standards regarding different parameters based on samplings at Icelandic conditions so the site characters in this report should be interpreted with that disclaimer in mind.

 NORSK AKKREDITERING TEST 079	Akvaplan-niva AS er akkreditert av Norsk Akkreditering for prøvetaking og faglig vurderinger og fortolkninger, akkrediteringsnummer TEST 079. Akkrediteringen er iht. NS-EN ISO/IEC 17025 Akkrediteringen omfatter bla. NS 9410, NS-EN ISO 5667-19 og NS-EN ISO 16665.
---	--

Akvaplan-niva AS thanks Arctic Sea Farm and their personnel for the cooperation during the conductance of this site survey.

Kópavogi 5. oktober 2021

Arnþór Gústavsson
Project manager

1 Introduction

The sampling date for the present site survey was 28.05 2021 and done by Akvaplan-niva AS contracted by Arctic Sea Farm in relation to the company's fish farming activity at the site Eyri in Patreksfjörður, Vesturbyggð municipality.

The objective of the B-survey is to document the environmental condition of the local impact zone of the fish farm according to NS 9410:2016 (and ISO 12878) which includes condition of the seabed, faunal evaluation and bottom topography registration.

The survey gives an estimate and evaluation of the site condition regarding organic load and impact assessment of the site from fish farming activity.

Figure 1 shows map of the fjord system of southern part of Vestfirðir where the site Eyri is located.

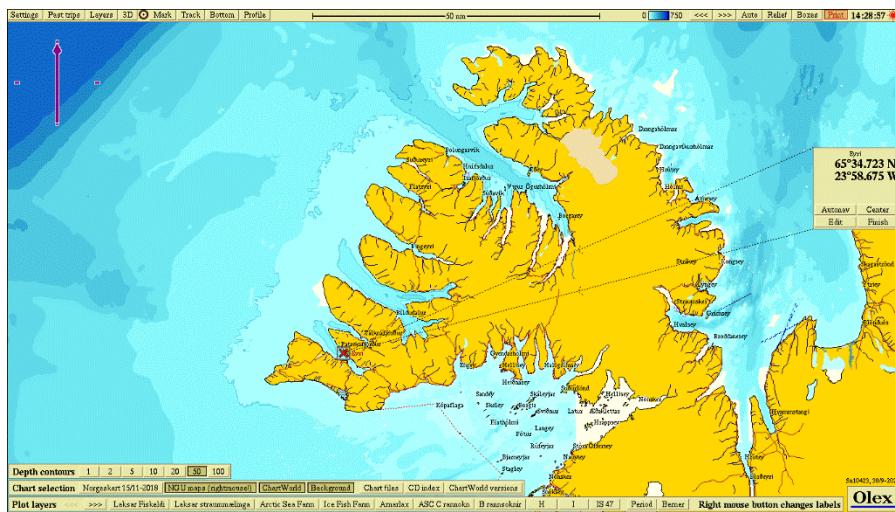

Figure 1. An overview map with the Eyri site market by its name with a red cross.

2 Methods

Environmental monitoring of the impact from the fish farming activities on the seabed is a standardised system. All fish farming sites in the sea are to be regularly assessed. The methods for monitoring in Iceland, are based on description in the ISO 12878 standard and methodology described in the NS 9410:2016 is followed. The Icelandic Environmental agency (Umhverfisstofnun) can also set forward specific requirements regarding frequency of samplings for different fish farming sites that can overrule the requirements in the above-mentioned standards.

The B-survey is a trend study of the benthic conditions at, or in proximity, to the fish farming site (local impact zone). Sediment is collected by use of grab (min 250 cm²). Each grab sample is investigated with regard to three observation types of benthic characters; faunal parameters, chemical parameters (pH and redox potential) and a sensory evaluation (gas bubbles, smell, texture, colour and the thickness of the precipitated slam layer in the sediment. The different benthic parameters are given a character on the scale from 1 to 4 (see Table 1), according to the scale of the impact on the benthic conditions from organic load, see criteria in table 1 and it is the weighted average for all the sampling stations that gives the sites condition. The number of sampling stations are decided based on the estimated max standing biomass for the given year class for farmed fish at the site.

Table 1. Frequency of category B-research for the location of the farm based on state of the defined farming area.

Site condition at the time of sampling	Sampling frequency for B-surveys (NS 9410:2016)
1-very good	At next max biomass
2-good	Prior to putting next generation into sea and again at next max biomass.
3-bad	Prior to putting next generation into sea. Based on the site condition prior to putting next generation into sea: <ul style="list-style-type: none">- Condition 1 – next site survey at next max biomass- Condition 2 – next site survey at next 50% max biomass and at max biomass- Condition 3 – next site survey at next 50% max biomass and at max biomass. Some conditions should apply for farming of next generation at the site <p>If any of the samples result in character 4 it is a sign of overload.</p>
4-very bad	Overload

2.1 Field equipment

The following field equipment was used during the site survey:

Grabb: Van Veen grabb (0,025 m²)

Sieve 1 mm: Akvaplan-niva

pH meter: Electrode, YSI Professional Plus

Redox-meter: Electrode, YSI Professional Plus

Position determination– Garmin GPS mapping tool.

Digital camera

3 Site description and bottom topography

3.1 Info site operation

The Eyri site is in Patreksfjörður, just outside of Patreksfjörður village and about 2 km southeast from Patreksfjörður harbor. The cages are lined in a west direction from land (270 degrees). The depth under cages ranges from about 52 - 54 m.

The previous generation farmed at the site was started with smolt transfer in the period from June to September 2018 and farmed until September 2020 when harvesting was finished. Eyri has been in a fallow state for more than eight months. The fish farm at the site is a 2x7 setup, total 14 cages each with 160 m circumference. During the last production cycle 10 out of 14 cages were used at some point and biomass peaking at around 5.000 tons.

Next generation will be transferred to the site, starting early June 2021 to 14 cages. Maximum biomass for next generation is estimated 7.448 tons.

Table 2 shows the production and feed usage for the past generation.

Table 2. Production and feed usage at the site Eyri, data is based on info from Arnarlax.

Generation of fish (G)	Production (ton)	Feed usage (ton)
Generation 2018 - 2020	5.967	7.117

3.2 Present and past site surveys

Previously there have been done two B bottom surveys at the Eyri site. A pre-survey was carried out in 2018 along with a C survey by Gunnarsson. S., prior to putting fish into sea. Bottom was described as muddy and visual and chemical parameters did not show any signs of organic load at the site. Redox potential was positive at all ten sampling stations.

In March 2020 a B-survey was done around the time when biomass was peaking. Results from max biomass study indicated good condition of the site and overall site status of 1 although there were indications of some organic load in the area.

Table 3. Past site studies for Eyri east site

Date of sampling	Report number	Survey type	Overall site status
17.05.2018	APN-60033.B01	B pre-survey	1
05.03.2020	APN-61958.B02	B survey max biomass	1

3.3 Dispersing current

Measurement of dispersing current was done at the site in March – May 2020 measurements at 43 m depth (Gunnarsson, 2020). Dominating current (43 m) is in direction north by north-west (330 degrees) with a smaller counter current in south by south-east direction. Average current speed is measured to be 5.0 cm/s. Highest current speed is measured to be 20.8 cm/s and 5.9 % of the measurements are < 1 cm/s.

3.4 Position of sampling stations

Description of the 22 stations in the survey is given in figure 2 and table 4. Positioning of the stations was chosen based on guidance and criteria described in NS 9410:2016 and spread around the periphery of the cages. At the site the typical depth in the local impact zone is in the range from 52 – 54 m, with a slightly deeper area on northern part of the mooring frame. The placement of sampling stations was chosen to give a good picture of the condition of the whole local impact zone. It is important to evaluate the status in both the deeper and shallower parts of the local impact zone of the fish farm. The sampling stations had a depth varying from 52 to 54 m. The placement of the sampling stations is regarded to be in accordance with the descriptions for survey of local impact zone given in NS 9410:2016.

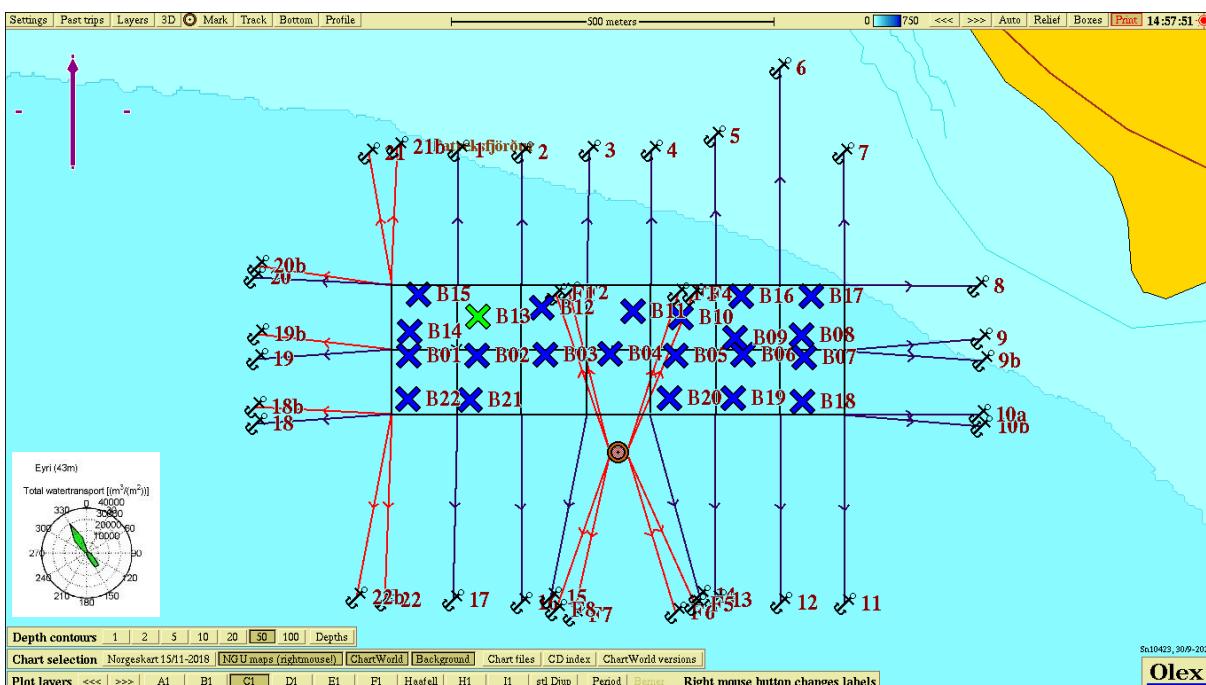

Figure 2. Chart showing Eyri farm. Sampling stations st. 1 – 22 are marked with color codes that describe the group II and III condition according to NS 9410:2016, chapter 7.11. Color codes: Blue = very good condition, green = good condition, yellow = bad condition, red = very bad condition.

Table 4. Placement and depth of the sampling stations in the B-survey.

4 Results

Results for the different parameters are given in Table 5. The overall site condition is 1 «very good». The status for group II (pH/Eh) was 1 «very good», status group III parameters (sensory) was 1 «very good» and average group II + III parameters is status 1 «very good». A complete filled sampling sheet with calculations for each parameter is attached in appendix.

Table 5. Results from the classifications of the local impact zone of the fish farm.

Parameter	Condition
Group II - parameters (pH/Eh)	1
Group III – parameters, (sensory)	1
Group II + III – parameters (mean value)	1
Site condition	1

There were collected valid sediment samples at all the twentytwo sampling stations. This indicates that in general there is soft bottom in the local impact zone. The sediment type consisted mainly of clay and silt in the whole farming area. For the group II parameters (pH/Eh), all stations had conditions 1 «very good». For sensory parameters (group III) sixteen stations had condition 1 «very good», five stations had condition 2 «good» and one station condition 3 «bad»(see Figure 3). For combined parameters II and III (pH/redox and sensory) twenty-one stations had status 1 «very good» and one stations had condition 2 «good»(see Figure 2). Animals where present in all the twentytwo soft bottom samples mainly in the form of polychaetes.

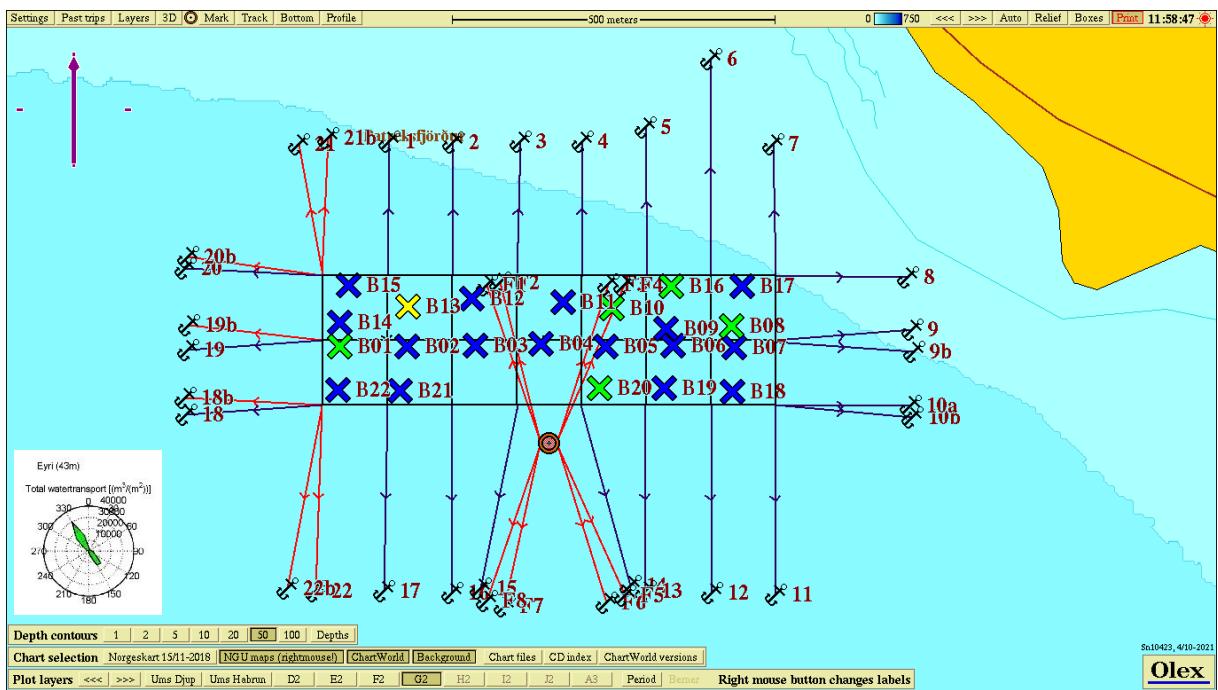

Figure 3. Chart showing Eyri farm. Sampling stations st. 1 – 22 are marked with color codes that describe the group III (sensory) condition according to NS 9410:2016, chapter 7.11. Color codes: Blue = very good condition, green = good condition, yellow = bad condition, red = very bad condition.

5 Conclusion

Based on the criteria given in NS 9410:2016 the fish farming site has been assigned a site condition 1 «very good» at the date of sampling. A total of 22 grabs were taken with Van Veen grab ($0,025\text{ m}^2$), placed around the 14 cages that are operated at the Eyri site during the present production cycle.

For combined parameters II and III (pH/redox and sensory) twenty-one stations had status 1 «very good» and one station had condition 2 «good». The stations with status 2 (station 13) is at the north-western part of the fish farming area. In general, organic material seemsto accumulate to a greater extent at the northern part of the fish farming area. Tendency of increased organic load becomes more pronounced when results from group III (sensory) are considered. The dominating current (43 m) is in direction north by northwest (330 degrees) with a smaller counter current. The apparent higher accumulation of organic material on the northern edge is in line with what can be expected in terms of disperse current. Animals were present in 21 samples, but none were observed in sample from sampling station 13. The previous B bottom survey (at max biomass) gave also overall condition 1 «very good». The results for the current B-survey at fallow indicate moderate organic load in small part of the site. Results are in line with previous surveys indicating overall very good condition in the local impact zone.

Results indicate moderate organic accumulation in part of the site, after farming one generation and just over eight months fallow period. A significant production increase is planned, with expected higher organic load for the next generation farmed at the site. The effect from this will be monitored at next B-survey at max biomass.

The site is assigned a condition factor 1 "very good" according to calculations based on methodology described in NS 9410:2016 and sample sheet Table B.1 and B.2 (se chapter 7 Appendix).
